The 3+1 b² House is derived from the juxtaposition of the technological and cultural influences of current times with the functionality of the New Orleans camelback housing style. The 3+1 b² House plan is asymmetrically configured to adapt to primary and secondary family or economic patterning. The second floor plan configuration for this design derives from historical arrangements in that style. The double camelback is an easily adapted building style for the climate measurements of the U.S. This Plan in long-term sustainability allows for natural ventilation through the bedrooms and also the benefits of cross-ventilation. Material selection of the Plan provides additional opportunities for natural ventilation in emergency regimes by lifting the living areas above base flood elevation. Essential to the camelback housing style is the truth that "Community begins at the front porch." Community begins at the front porch.
